

Security work, documented and ongoing.

A concise update on Pactuno's internal SOC 2 readiness work as of October 16, 2026. SOC 1 applicability remains to be assessed.

Progress completed so far

Readiness planning Prepared an internal SOC 2 readiness tracker, an initial risk register, and draft policy templates to organize security work. SOC 1 applicability remains to be assessed.	Application safeguards Added and tested selected protections for account access, permissions, tenant boundaries, file handling, and request origins.
PacVault privacy controls Built a local browser-extension package with optional site access, clear consent, review-before-save, and same-site fill behavior.	Automated checks The current local application regression suite passed. The PacVault extension package suite passed 5 of 5 tests. These checks cover selected behavior only.

What this progress means

These items describe internal preparation and selected engineering work. Passing local tests does not prove that every safeguard is active in production or consistently operating over time. Some controls still require production validation, assigned owners, approved policies, and ongoing evidence collection.

No SOC attestation is claimed. Pactuno has not completed an independent SOC 1 or SOC 2 examination and does not claim certification or a SOC badge. Only an independent qualified auditor can issue an attestation report.

Privacy and publication

This public copy contains no customer records, credentials, secrets, private service configuration, or detailed internal findings. It summarizes progress without exposing operational security details. For the current public overview, visit pactuno.online/security-readiness.html.

Readiness documentation is a work in progress and is reviewed as implementation and evidence change.
